

High voltage half-bridge driver

Datasheet - production data

Features

- High voltage rail up to 600 V
- dV/dt immunity ± 50 V/nsec in full temperature range
- Driver current capability
 - 400 mA source
 - 650 mA sink
- Switching times 50/30 nsec rise/fall with 1 nF load
- CMOS/TTL Schmitt trigger inputs with hysteresis and pull-down
- Shutdown input
- Deadtime setting
- Undervoltage lockout
- Integrated bootstrap diode
- Clamping on V_{CC}
- Available in DIP-8/SO-8 packages

Applications

- Home appliances
- Induction heating
- HVAC
- Industrial applications and drives
- Motor drivers
 - DC, AC, PMDC and PMAC motors
- Lighting applications
- Factory automation
- Power supply systems

Description

The L6384E is a high voltage gate driver, manufactured with the BCD™ “offline” technology, and able to drive a half-bridge of power MOS or IGBT devices. The high-side (floating) section is enabled to work with voltage rail up to 600 V. Both device outputs can sink and source 650 mA and 400 mA respectively and cannot be simultaneously driven high thanks to an integrated interlocking function. Further prevention from outputs cross conduction is guaranteed by the deadtime function, tunable by the user through an external resistor connected to the DT/SD pin.

The L6384E device has one input pin, one enable pin (DT/SD) and two output pins, and guarantees matched delays between low-side and high-side sections, thus simplifying device's high frequency operation. The logic inputs are CMOS/TTL compatible to ease the interfacing with controlling devices. The bootstrap diode is integrated inside the device, allowing a more compact and reliable solution.

The L6384E features the UVLO protection and a voltage clamp on the V_{CC} supply voltage. The voltage clamp is typically around 15.6 V and is useful in order to ensure a correct device functioning in cases where V_{CC} supply voltage is ramped up too slowly or is subject to voltage drops.

The device is available in a DIP-8 tube and SO-8 tube and tape and reel packaging options.

2 Electrical data

2.1 Absolute maximum ratings

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{out}	Output voltage	-3 to $V_{boot} - 18$	V
V_{cc}	Supply voltage ⁽¹⁾	- 0.3 to 14.6	V
I_s	Supply current ⁽¹⁾	25	mA
V_{boot}	Floating supply voltage	-1 to 618	V
V_{hvg}	High-side gate output voltage	-1 to V_{boot}	V
V_{lvg}	Low-side gate output voltage	-0.3 to $V_{cc} + 0.3$	V
V_i	Logic input voltage	-0.3 to $V_{cc} + 0.3$	V
V_{sd}	Shutdown/deadtime voltage	-0.3 to $V_{cc} + 0.3$	V
dV_{out}/dt	Allowed output slew rate	50	V/ns
P_{tot}	Total power dissipation ($T_j = 85\text{ °C}$)	750	mW
T_j	Junction temperature	150	°C
T_s	Storage temperature	-50 to 150	°C

1. The device has an internal clamping Zener between GND and the Vcc pin, It must not be supplied by a low impedance voltage source.

2.2 Thermal data

Table 3. Thermal data

Symbol	Parameter	SO-8	DIP-8	Unit
$R_{th(JA)}$	Thermal resistance junction to ambient	150	100	°C/W

2.3 Recommended operating conditions

Table 4. Recommended operating conditions

Symbol	Pin	Parameter	Test condition	Min.	Typ.	Max.	Unit
V_{out}	6	Output voltage		⁽¹⁾		580	V
$V_{BS}^{(2)}$	8	Floating supply voltage		⁽¹⁾		17	V
f_{sw}		Switching frequency	HVG, LVG load $C_L = 1\text{ nF}$			400	kHz
V_{cc}	2	Supply voltage				V_{clamp}	V
T_j		Junction temperature		-45		125	°C

1. If the condition $V_{boot} - V_{out} < 18\text{ V}$ is guaranteed, V_{out} can range from -3 to 580 V.
 2. $V_{BS} = V_{boot} - V_{out}$.

3 Pin connection

Figure 2. Pin connection (top view)

Table 5. Pin description

No.	Pin	Type	Function
1	IN	I	Logic input: it is in phase with HVG and in opposition of phase with LVG. It is compatible to V _{CC} voltage. (V _{il} Max = 1.5 V, V _{ih} Min = 3.6 V).
2	V _{CC}	P	Supply input voltage: there is an internal clamp [typ. 15.6 V].
3	DT/SD	I	High impedance pin with two functionalities. When pulled lower than V _{dt} (typ. 0.5 V), the device is shut down. A voltage higher than V _{dt} sets the deadtime between the high-side gate driver and low-side gate driver. The deadtime value can be set forcing a certain voltage level on the pin or connecting a resistor between the pin 3 and ground. Care must be taken to avoid below threshold spikes on the pin 3 that can cause undesired shutdown of the IC. For this reason the connection of the components between the pin 3 and ground has to be as short as possible. This pin can not be left floating for the same reason. The pin has not be pulled through a low impedance to V _{CC} , because of the drop on the current source that feeds R _{dt} . The operative range is: V _{dt} ... 270 KΩ · I _{dt} , that allows a dt range of 0.4 - 3.1 μs.
4	GND	P	Ground
5	LVG	O	Low-side driver output: the output stage can deliver 400 mA source and 650 mA sink (typ. values). The circuit guarantees 0.3 V max. on the pin (at I _{sink} = 10 mA) with V _{CC} > 3 V and lower than the turn-on threshold. This allows to omit the bleeder resistor connected between the gate and the source of the external MOSFET normally used to hold the pin low; the gate driver ensures low impedance also in SD conditions.
6	V _{out}	P	High-side driver floating reference: layout care has to be taken to avoid below ground spikes on this pin.
7	HVG	O	High-side driver output: the output stage can deliver 400 mA source and 650 mA sink (typ. values). The circuit guarantees 0.3 V max. between this pin and V _{out} (at I _{sink} = 10 mA) with V _{CC} > 3 V and lower than the turn-on threshold. This allows to omit the bleeder resistor connected between the gate and the source of the external MOSFET normally used to hold the pin low; the gate driver ensures low impedance also in SD conditions.
8	Vboot	P	Bootstrap supply voltage: it is the high-side driver floating supply. The bootstrap capacitor connected between this pin and the pin 6 can be fed by an internal structure named "bootstrap driver" (a patented structure). This structure can replace the external bootstrap diode.

4 Electrical characteristics

4.1 AC operation

Table 6. AC operation electrical characteristics ($V_{CC} = 14.4V$; $T_J = 25^\circ C$)

Symbol	Pin	Parameter	Test condition	Min.	Typ.	Max.	Unit
t_{on}	1 vs. 5, 7	High/low-side driver turn-on propagation delay	$V_{out} = 0V$ $R_{dt} = 47k\Omega$		200+ dt		ns
t_{onsd}	3 vs. 5, 7	Shutdown input propagation delay			220	280	ns
t_{off}	1 vs. 5, 7	High/low-side driver turn-off propagation delay	$V_{out} = 0V$ $R_{dt} = 47k\Omega$		250	300	ns
			$V_{out} = 0V$ $R_{dt} = 146k\Omega$		200	250	ns
			$V_{out} = 0V$ $R_{dt} = 270k\Omega$		170	200	ns
t_r	5, 7	Rise time	$C_L = 1000pF$		50		ns
t_f	5, 7	Fall time	$C_L = 1000pF$		30		ns

4.2 DC operation

Table 7. DC operation electrical characteristics ($V_{CC} = 14.4V$; $T_J = 25^\circ C$)

Symbol	Pin	Parameter	Test condition	Min.	Typ.	Max.	Unit
Supply voltage section							
V _{clamp}	2	Supply voltage clamping	I _s = 5 mA	14.6	15.6	16.6	V

V _{ccth2}	2	V _{CC} UV turn-off threshold		9.5	10	10.5	V
V _{cchys}		V _{CC} UV hysteresis			2		V
I _{qccu}		Undervoltage quiescent supply current	V _{cc} ≤ 11 V		150		μA
I _{qcc}		Quiescent current	V _{in} = 0		380	500	μA
Bootstrapped supply voltage section							
V _{boot}	8	Bootstrap supply voltage				17	V
I _{QBS}		Quiescent current	IN = HIGH			100	μA
I _{LK}		High voltage leakage current	V _{hvg} = V _{out} = V _{boot} = 600 V			10	μA
R _{dson}		Bootstrap driver on-resistance ⁽¹⁾	V _{cc} ≥ 12.5 V; IN = LOW		125		Ω
High/low-side driver							
I _{so}	5, 7	Source short-circuit current	V _{IN} = V _{ih} (t _p < 10 μs)	300	400		mA
I _{si}		Sink short-circuit current	V _{IN} = V _{il} (t _p < 10 μs)	500	650		mA

Table 7. DC operation electrical characteristics (continued)($V_{CC} = 14.4\text{ V}$; $T_J = 25\text{ }^{\circ}\text{C}$)

Symbol	Pin	Parameter	Test condition	Min.	Typ.	Max.	Unit
Logic inputs							
V_{il}	1, 3	Low level logic threshold voltage				1.5	V
V_{ih}		High level logic threshold voltage		3.6			V
I_{ih}		High level logic input current	$V_{IN} = 15\text{ V}$		50	70	μA
I_{il}		Low level logic input current	$V_{IN} = 0\text{ V}$			1	μA
I_{ref}	3	Deadtime setting current			28		μA
dt	3 vs. 5, 7	Deadtime setting range ⁽²⁾	$R_{dt} = 47\text{ k}\Omega$ $R_{dt} = 146\text{ k}\Omega$ $R_{dt} = 270\text{ k}\Omega$	0.4	0.5 1.5 2.7		μs μs μs
V_{dt}	3	Shutdown threshold			0.5		V

1. $R_{DS(on)}$ is tested in the following way:

$$R_{DS(on)} = \frac{(V_{CC} - V_{CBOOT1}) - (V_{CC} - V_{CBOOT2})}{I_1(V_{CC}, V_{CBOOT1}) - I_2(V_{CC}, V_{CBOOT2})}$$

Where I_1 is the pin 8 current when $V_{CBOOT} = V_{CBOOT1}$, I_2 when $V_{CBOOT} = V_{CBOOT2}$.

2. The pin 3 is a high impedance pin. Therefore dt can be set also forcing a certain voltage V_3 on this pin. The deadtime is the same obtained with an R_{dt} if it is: $R_{dt} \times I_{ref} = V_3$.

4.3 Timing diagram

Figure 3. Input/output timing diagram

5 Bootstrap driver

A bootstrap circuitry is needed to supply the high voltage section. This function is normally accomplished by a high voltage fast recovery diode ([Figure 4 a](#)). In the L6384E device a patented integrated structure replaces the external diode. It is realized by a high voltage DMOS, driven synchronously with the low-side driver (LVG), with a diode in series, as shown in [Figure 4 b](#). An internal charge pump ([Figure 4 b](#)) provides the DMOS driving voltage. The diode connected in series to the DMOS has been added to avoid undesirable turn-on.

C_{BOOT} selection and charging

To choose the proper C_{BOOT} value the external MOS can be seen as an equivalent capacitor. This capacitor C_{EXT} is related to the MOS total gate charge:

Equation 1

$$C_{EXT} = \frac{Q_{gate}}{V_{gate}}$$

The ratio between the capacitors C_{EXT} and C_{BOOT} is proportional to the cyclical voltage loss. It has to be:

$$C_{BOOT} \gg C_{EXT}$$

E.g.: if Q_{gate} is 30 nC and V_{gate} is 10 V, C_{EXT} is 3 nF. With C_{BOOT} = 100 nF the drop would be 300 mV.

If HVG has to be supplied for a long time, the C_{BOOT} selection has to take into account also the leakage losses.

E.g.: HVG steady state consumption is lower than 100 μA, so if HVG T_{ON} is 5 ms, C_{BOOT} has to supply 0.5 μC to C_{EXT}. This charge on a 1 μF capacitor means a voltage drop of 0.5 V.

The internal bootstrap driver gives great advantages: the external fast recovery diode can be avoided (it usually has a great leakage current).

This structure can work only if V_{OUT} is close to GND (or lower) and in the meanwhile the LVG is on. The charging time (T_{charge}) of the C_{BOOT} is the time in which both conditions are fulfilled and it has to be long enough to charge the capacitor.

The bootstrap driver introduces a voltage drop due to the DMOS R_{DSON} (typical value: 125 Ω). At low frequency this drop can be neglected. Anyway increasing the frequency it must be taken in to account.

The following equation is useful to compute the drop on the bootstrap DMOS:

Equation 2

$$V_{drop} = I_{charge} R_{dson} \rightarrow V_{drop} = \frac{Q_{gate}}{T_{charge}} R_{dson}$$

where Q_{gate} is the gate charge of the external power MOS, R_{dson} is the on-resistance of the bootstrap DMOS, and T_{charge} is the charging time of the bootstrap capacitor.

For example: using a power MOS with a total gate charge of 30 nC, the drop on the bootstrap DMOS is about 1 V, if the T_{charge} is 5 μs . In fact:

Equation 3

$$V_{\text{drop}} = \frac{30\text{nC}}{5\mu\text{s}} \cdot 125\Omega \sim 0.8\text{V}$$

V_{drop} has to be taken into account when the voltage drop on C_{BOOT} is calculated: if this drop is too high, or the circuit topology doesn't allow a sufficient charging time, an external diode can be used.
